

Baby Monitor

An Internet-Of-Things Device

Kelsey D'Souza

Outline

- Overview: From Problem to Architecture
- Software: languages, protocols, libraries used
- Hardware: electrical schematic
- Science: acceptable body temperatures

Overview

*Kept aware of baby's conditions
Decides about corrective measure*

Parent
upstairs, downstairs, elsewhere

*Notify of abnormal temperature
OK to turn on heater or fan?*

SMS

Y or N (to turn on heater or fan)

http

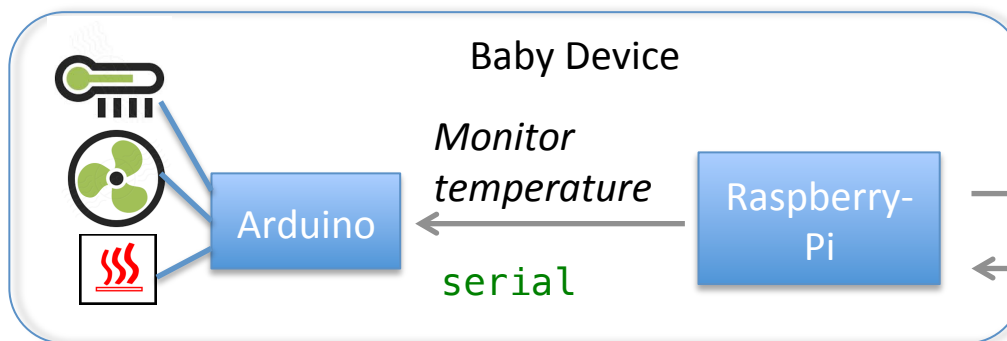

*Browse device stats and graphs
Directly control device*

Turn fan or heater
On / Off

Body and Environment Temperature fluctuate

Hardware

Software

- Arduino
 - Programmed in Arduino-C, runs Standard Firmata
- Raspberry-Pi
 - Programmed in Python
 - BreakfastSerial.py module to control Arduino
 - Requests.py to send http requests
 - Bottle.py module to run local web-server
- Baby Server
 - Programmed in Python
 - Bottle.py module to run local web-server
 - Requests.py to send http requests
 - Twilio.py to communicate with Twilio http-SMS gateway
